MRSA/ORSA (Methicillin/Oxacillin-Resistant *Staphylococcus aureus*) and your child

What is MRSA/ORSA?

Staphylococcus aureus, or “staph,” is a bacterium normally found on our skin and in our respiratory tract. Staph can be on our bodies normally without causing infection (called “colonization”), but it can also cause infection. MRSA stands for “methicillin-resistant *Staphylococcus aureus*,” and ORSA stands for “oxacillin-resistant *Staphylococcus aureus*.” MRSA and ORSA are staph bacteria that are resistant to the antibiotic medicines (methicillin and oxacillin) commonly used to treat staph infections. Unlike normal staph, these bacteria are resistant to common treatments, so they are infections that are very hard to treat. For more information about MRSA, please visit

<http://www.niaid.nih.gov/topics/antimicrobialresistance/examples/mrsa/pages/default.aspx>. For more information about antibiotic-resistant bacteria, please visit

<http://www.niaid.nih.gov/topics/antimicrobialresistance/Pages/default.aspx>.

How can someone get MRSA/ORSA?

You can get MRSA/ORSA in the community or in a hospital from someone else with MRSA/ORSA. It is spread by close contact with a person with MRSA/ORSA or by touching objects in your surroundings with MRSA/ORSA on them. You can also get MRSA/ORSA if the normal staph bacteria on your skin become resistant to the antibiotics that you are taking.

How does the Clinical Center test for MRSA/ORSA?

- If your child has MRSA/ORSA, MRSA/ORSA may grow and be visible in your child’s cultures when lab tests are done.
- To find out if your child is colonized with MRSA/ORSA in his/her respiratory tract, his/her nose will be swabbed. This test is not painful and may be repeated while at the hospital. A medical staff member must perform this test; you cannot perform this test yourself.

Important things to know

- Read “Patient Information—Hand hygiene and your child.”
- Read “Patient Information—Contact isolation and your child.”

Hand hygiene

Hand hygiene is the most important way to prevent the spread of germs, including antibiotic-resistant bacteria. Wash your hands and your child’s hands with soap and water or use alcohol hand rub often. Ask your care providers and visitors to wash their hands frequently.

Patients

- Isolation
 - If your child has MRSA/ORSA, then he/she will be on contact isolation at the hospital to stop his/her MRSA/ORSA from accidentally spreading to other people.

- You and your child must follow the directions given in the “Patient Information—Hand hygiene and your child” and “Patient Information—Contact isolation and your child” information sheets.
- Gowns and Gloves
Staff will wear a gown and gloves when they are in the room caring for your child.

Family and visitors

All visitors must follow the directions given in the “Patient Information—Hand hygiene and your child” and “Patient Information—Contact isolation and your child” information sheets.

How do I get rid of MRSA/ORSA?

- If your child has MRSA/ORSA, then the doctor will treat it. If your child is colonized with MRSA/ORSA, and not infected by it, then it may go away without treatment.
- MRSA/ORSA on hands can be removed by good hand hygiene.
- MRSA/ORSA on objects in your surroundings can be killed by cleaning with disinfectant.

When will isolation end?

- Your child will be on isolation until his/her MRSA/ORSA infection is fully treated and not able to spread to others by accident. Your child’s care provider will tell you when your child’s isolation ends.
- Your child will be on isolation as an inpatient and outpatient until the Hospital Epidemiology Service determines that isolation is no longer needed.
- Isolation does not determine the length of your child’s hospital stay.

Questions?

Ask your child’s nurse or doctor, or call the Hospital Epidemiology Service at 301-496-2209. For more information, please visit the NIH Clinical Center’s Patient Portal

http://patientportal.cc.nih.gov/pt_care/patient_infection_control.shtml.
